

## Example 1: 80 days weather

---

All sunny days except the last 16 days:

SSS...RRRSSSSRRRRSSSS

69

## Example 2: 80 days weather

---

All sunny days except the last 16 days:

SSS...RRRCSSSSRRRRCS

70

## Run-length coding

---

- Run-length coding (encoding) is a very widely used and simple compression technique
  - does not assume a memoryless source
  - replace runs of symbols (possibly of length one) with pairs of (symbol, run-length)

33

## Uniquely decodable

---

- Uniquely decodable is a prefix free code if no codeword is a proper prefix of any other
- For example {1, 100000, 00} is uniquely decodable, but is not a prefix code
  - consider the codeword {...1000000001...}
- In practice, we prefer prefix code (why?)

56

## Static codes

---

- Mapping is fixed before transmission
  - E.g., Huffman coding
- probabilities known in advance

60

## Dynamic codes

---

- Mapping changes over time
  - i.e. adaptive coding
- Attempts to exploit locality of reference
  - periodic, frequent occurrences of messages
  - e.g., dynamic Huffman

61

## Variable length coding

- Also known as entropy coding
  - The number of bits used to code symbols in the alphabet is variable
  - E.g. Huffman coding, Arithmetic coding

64

## Entropy

- What is the minimum number of bits per symbol?
- Answer: Shannon's result – theoretical minimum average number of bits per code word is known as Entropy (H)

$$\sum_{i=1}^n -p(s_i) \log_2 p(s_i)$$

65

## Huffman coding algorithm

1. Take the two least probable symbols in the alphabet  
(longest code words, equal length, differing in last digit)
2. Combine these two symbols into a single symbol
3. Repeat

69

## Example

S	Freq	Huffman
a	30	00
b	30	01
c	20	10
d	10	110
e	10	111

76

## Another example

- S={a, b, c, d} with freq {4, 2, 1, 1}
- $H = 4/8 \log_2 2 + 2/8 \log_2 4 + 1/8 \log_2 8 + 1/8 \log_2 8$
- $H = 1/2 + 1/2 + 3/8 + 3/8 = 1.75$
- a => 0    b => 10    c => 110    d => 111
- Message: {abcdabaa} => {0 10 110 111 0 10 0 0}
- Average length L = 14 bits / 8 chars = 1.75
- If equal probability, i.e. fixed length, need  $\log_2 4 = 2$  bits

80

## Problems of Huffman coding

- Huffman codes have an integral # of bits.
  - E.g.,  $\log(3) = 1.585$  while Huffman may need 2 bits
- Noticeable non-optimality when prob of a symbol is high.

=> Arithmetic coding

87

## Arithmetic coding

Character	Probability	Range
SPACE	1/10	0.00 - 0.10
A	1/10	0.10 - 0.20
B	1/10	0.20 - 0.30
E	1/10	0.30 - 0.40
G	1/10	0.40 - 0.50
I	1/10	0.50 - 0.60
L	2/10	0.60 - 0.80
S	1/10	0.80 - 0.90
T	1/10	0.90 - 1.00

90

## Arithmetic coding

New Character	Low value	High Value
	0.0	1.0
B	0.2	0.3
I	0.25	0.26
L	0.256	0.258
L	0.2572	0.2576
SPACE	0.25720	0.25724
G	0.257216	0.257220
A	0.2572164	0.2572168
T	0.25721676	0.2572168
E	0.257216772	0.257216776
S	<u>0.2572167752</u>	0.2572167756

92

## COMP9319 Web Data Compression and Search

LZW,  
Adaptive Huffman

1

## Dictionary coding

- Patterns: correlations between part of the data
- Idea: replace recurring patterns with references to dictionary
- LZ algorithms are adaptive:
  - Universal coding (the prob. distr. of a symbol is unknown)
  - Single pass (dictionary created on the fly)
  - No need to transmit/store dictionary

2

## Lempel-Ziv-Welch (LZW) Algorithm

- Most popular modification to LZ78
- Very common, e.g., Unix compress, TIFF, GIF, PDF (until recently)
- Read <http://en.wikipedia.org/wiki/LZW> regarding its patents
- Fixed-length references (12bit 4096 entries)
- Static after max entries reached

4

## Problems of Huffman coding

Need statistics & static: e.g., single pass over the data just to collect stat & stat unchanged during encoding

To decode, the stat table need to be transmitted. Table size can be significant for small msg.

=> Adaptive compression e.g., adaptive huffman

39

## Adaptive Huffman Coding (dummy)

Encoder	Decoder
Reset the stat	Reset the stat
Repeat for each input char	Repeat for each input char
(	(
Encode char	Decode char
Update the stat	Update the stat
Rebuild huffman tree	Rebuild huffman tree
)	)

This works but too slow!

42

## Terminology (Types)

- Block-block
  - source message and codeword: fixed length
  - e.g., ASCII
- Block-variable
  - source message: fixed; codeword: variable
  - e.g., Huffman coding
- Variable-block
  - source message: variable; codeword: fixed
  - e.g., LZW
- Variable-variable
  - source message and codeword: variable
  - e.g., Arithmetic coding

52

## Summarised schedule

0. Information Representation (today)
1. Compression
2. Search
3. Compression + Search on plain text
4. "Compression + Search" on Web text
5. Selected advanced topics (if time allows)

26

## COMP9319 Web Data Compression and Search

Basic BWT

1

Basic BWT  
(to be discussed more detailed  
next week)

2

## Recall from Lecture 1's RLE and BWT example
